

Limitations: list here all limitations, what does not work, what works partially, what you had hoped to accomplish but did not get to it.

1. Testing:

As the project grows, there may be challenges finding and resolving defects if there is little or no automated testing.

2. Limited Styling:

The application that is offered could not have a well-designed user interface because its primary objective is usefulness instead of beauty. Enhancements to the styling could make the user experience better overall.

3. Notifications:

The current version might not support real-time notifications for upgrades or changes.
